Education

National Institute of Technology, Patna

2018 - 2022

Bachelor of Technology in Electrical Engineering (CGPA: 7.23 / 10)

Patna, Bihar

- **Relevant Coursework:** Data Structures and Algorithms (C), Object Oriented Programming (Java), The Joy of Computing Using Python, Artificial Intelligence Fundamentals, Operating System Fundamentals

Experience

Publicis Sapient

Aug 2025 – Present

Software Engineer

Noida, UP

Cruise Booking & Mid-Term Bundling Platform

- Built a Next.js + AEM-driven mid-term bundling engine enabling dynamic fare upgrades and drinks packages, directly contributing to increased ancillary revenue.
- Implemented SSR-based data orchestration to improve SEO, reduce client-side latency, and support high-traffic booking periods.
- Enabled editable summary checkout flows, improving conversion by allowing guests to modify selections without restarting the booking journey.
- Extended bundling logic into post-booking OBR flows, unlocking additional upsell opportunities after purchase completion.

Accenture

Oct 2022 – Aug 2025

Software Engineer

Mumbai, MH

Real-Time Payment Reconciliation & Fraud Detection System

- Designed and implemented an event-driven payment processing platform using Spring Boot, Kafka, and Docker, handling 1–3M transactions/day with less than 250 ms P90 API latency.
- Built a strict payment state machine that eliminated 100% of refund-before-settlement incidents and prevented timing-based payment fraud.
- Implemented real-time behavioral fraud detection (velocity, retry, refund abuse, device reuse) with stateful stream processing, reducing chargebacks by 40–50% QoQ.
- Introduced an immutable double-entry ledger service, ensuring exactly-once financial accounting and enabling audit-ready reconciliation.
- Built T+1/T+2 reconciliation pipelines comparing ledger, gateway, and bank settlement files, detecting 100% of settlement mismatches and reducing manual finance investigation time by 70%.
- Established production observability (Kafka lag, PENDING duration, fraud block rate, ledger deltas), enabling proactive detection of money-risk incidents within minutes instead of hours.

Living Design System

- Developed a scalable Living Design System using React, TypeScript, TailwindCSS, and shadcn/ui, enabling rapid and consistent UI development across multiple product teams.
- Integrated theming tokens, utility classes, and reusable components (Atoms, Molecules, Organisms) to ensure brand consistency and accessibility (WCAG 2.1 AA) compliance.
- Reduced UI development time by 40% through component standardization and automated documentation via Storybook and Figma token synchronization.
- Implemented dynamic theming with design tokens using Tailwind's CSS variables, improving design-to-development parity and reducing manual color/style overrides by 60%.
- Optimized bundle size and build performance by 25% through tree-shaking, code splitting, and design token refactoring.

Technical Skills

Languages: C, C++, Java, JavaScript, TypeScript, SQL

Databases: PostgreSQL

Technologies: React.js, Next.js, Spring Boot, Apache Kafka, Redis, Git, CI/CD, AWS, AEM

Tools: Jira, GitHub, Bitbucket

Core Concepts: Data Structures and Algorithms, Microservices, Microfrontend Architecture(MFE), Distributed Systems, Operating Systems, RESTful APIs, Database Design, Agile/Scrum, Cloud Computing
